

INSIGHTS & RECOMMENDATIONS

B2B Sales Pipeline & Performance Analysis | Microsoft Excel

Executive Summary

This analysis evaluates B2B sales pipeline performance across deal stages, deal values, products, sales agents, and regional offices. The analysis identifies revenue concentration, deal-value patterns, and regional/product mix differences to support data-driven sales decisions.

Key Business Insights

1. Won Deal Values Are Highly Right-Skewed

The average Won deal value is ₹2,360.91, compared with a median of ₹1,117. This indicates that a relatively small number of high-value deals are pulling the average upward, while most Won deals are at lower values.

Median deal value should be considered alongside the average when evaluating typical deal size, because the average alone can overstate the value of a typical Won deal.

2. Won Revenue Is Concentrated Across a Few Products

Three products contribute the largest shares of Won revenue: GTX Pro (₹3.51M), GTX Plus Pro (₹2.63M), and MG Advanced (₹2.22M). Together, these products account for a substantial portion of total Won revenue.

The sales portfolio is not evenly distributed across products. Monitoring the performance and demand of the leading products is important because changes in these products could have a meaningful effect on overall Won revenue.

3. A Smaller Group of Won Deals Generates a Significant Share of Revenue

The top 10% of Won deals contribute 27.58% of total Won revenue, while the remaining 90% contribute 72.42%.

Revenue is meaningfully influenced by higher-value deals. Sales teams should therefore monitor both deal volume and deal value when evaluating pipeline performance, rather than focusing only on the number of Won opportunities.

4. High-Value GTK 500 Deals Show a Concentration Pattern

All 15 Won deals valued above ₹10,000 are GTK 500 deals. These deals are concentrated in the West regional office and involve three sales agents.

This concentration is a pattern to investigate rather than evidence that the product, region, or agents caused the higher deal values. Further analysis could examine the underlying customer, deal, and sales-process characteristics associated with these deals.

5. East Region Shows a Higher Share of Higher-Value Products

The East regional office has a 50.95% share of higher-value products, compared with approximately 41% in both Central and West. East also has the highest average Won deal value at ₹2,639.28.

The difference suggests a regional product-mix pattern that could be investigated further. The East region's sales approach and customer/product mix may provide useful hypotheses for understanding higher-value deal patterns, but the analysis does not establish causation.

Business Recommendations

1. Increase Value of Smaller Deals

Focus on upselling and cross-selling opportunities within smaller Won deals to increase average deal value while maintaining deal volume.

2. Monitor Core Product Revenue Concentration

Continue monitoring GTX Pro, GTX Plus Pro, and MG Advanced because they contribute substantially to Won revenue. Changes in their demand or sales performance could materially affect overall revenue.

3. Investigate the GTK 500 Concentration Pattern

Examine the customer characteristics, deal conditions, and sales processes associated with the 15 high-value GTK 500 Won deals, particularly the West-region and three-agent concentration.

4. Investigate the East Region's Product Mix

Study the East region's higher-value product mix to identify potential sales approaches or customer patterns that could be tested in other regions. Treat this as a hypothesis for further analysis rather than a proven causal relationship.

Analysis Limitations

1. Missing Engage Dates

500 opportunities have missing engage dates, which limits the completeness of sales-cycle analysis for those records.

2. Date Parsing Ambiguity

Some dates with day values of 12 or below may have date-format ambiguity. This should be considered when interpreting date-based analysis.

3. Potential Duplicate Records

513 potential near-duplicate records were flagged during data-quality checks and retained for analysis because they were not confirmed as duplicates.

4. Association Does Not Establish Causation

Observed relationships between products, regions, sales agents, and deal values represent associations in the dataset. They should not be interpreted as evidence that one factor caused another.
